# Introduction

ECM-XF is a cost effective EtherCAT Master chip connect with Control master by SPI interface. Provide users with minimum 125 us DC cycle time and 128 slaves. Support multiple surrounding IO, interrupt and application. Suitable for PLC controller, robot controller or multi-automation controller.

Support DC	Yes
Maximum Slaves	128
Minimum Cycle Time	125us
Mailbox Protocol	CoE/FoE
Surrounding IO	GPIO / QEI / ADC / DAC
Application function	CiA402 state machine control FIFO buffer

## Interface

Pic. 1、 ECM-XF interface connection

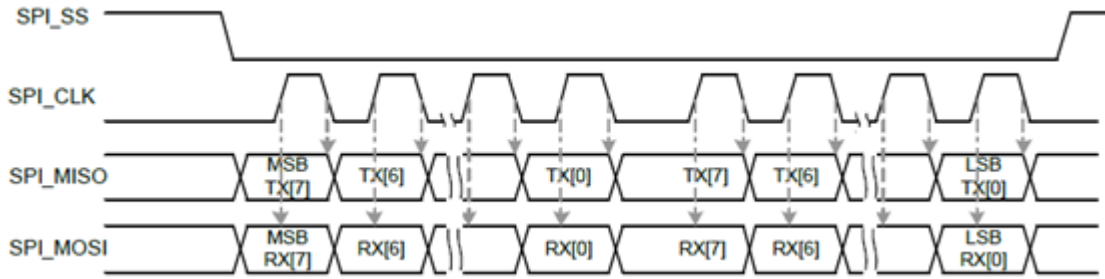

## SPI Mode

Name	Pin Number	Meaning	Description
SPI_CLK	Pin 38	Signal Frequency	The minimum frequency generate and control by SPI Master to connect EtherCAT communication cycle.
SPI_MOSI	Pin 40	Master Out, Slave In	SPI Master data output, SPI Slave data input
SPI_MISO	Pin 39	Master In, Slave Out	SPI Master data input, SPI Slave data output
SPI_SS	Pin 37	SPI Slave Select	Option signal, control by master. The slave only react with master when the level in low.

Duplex Mode	Full duplex		
Transmission Rate	96Mbps(max.)		
Timing Mode	SPI_CLK at low level when idling, upward edges receive data, downward edges transmit data		
	POL=0	PHA=0	
	POL=0	TXNEG=1	RXNEG=0

### SPI Mode Transmission

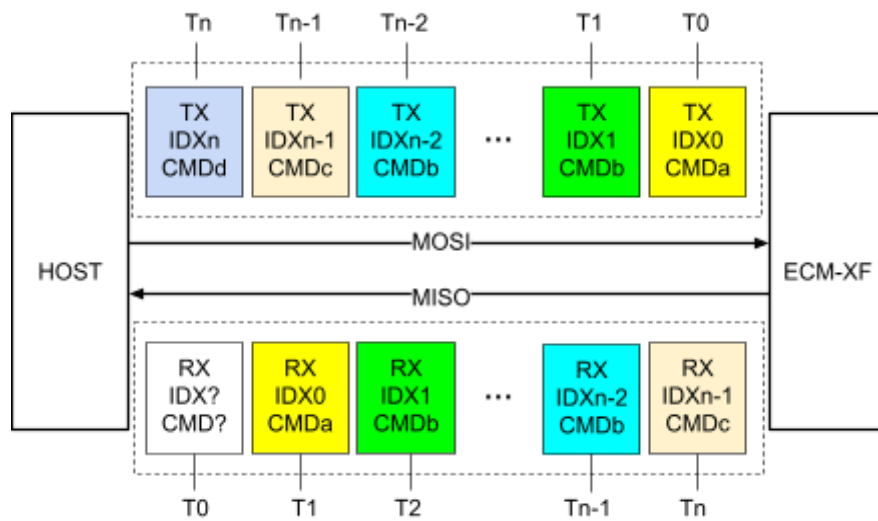

In ECM SPI Slave mode, SPI\_CLK at low level when idling, upward edges receive data, downward edges transmit data, following MSB like picture shows below.

Pic. 2 SPI Timing

SPI Master generates clock to SPI slaves, transmitting data at the edges of high levels, receiving data at the edge of low levels. SPI transmission packs on Byte. Transmitting from the lowest address to the highest address. It means it starts at Byte 0, Byte 1, Byte 2 to the last Byte. But the SPI transmitting Byte is followed by MSB.

### SPI Command Transmit and Receive

Pic 3. SPI full duplex data packet exchange

#### Warning

1. Master will receive the last data packet when transmitting the SPI command.
2. When ECM-XF enabled, the first return packet does not include the last respond packet.
3. If command packets are same at index code and command code, the commands will be treated as ECM\_CMD\_INFO\_UPDATE\_OP except the first one.

## Packet Format

1. Command packet includes 4 parts: header, data, check word and end word.
2. Command header include commands, parameters, and system control, etc.
3. Return header include command return values, return data, error states and system state, etc.
4. Data section include PDO data or including data. The data size could be modified by application.
5. Check word has 4 different types for users as following: Fixed value (0x12345678), CRC-8, CRC-CCITT, CRC 32.
6. End word is a fixed value(0x56575859) for checking packet completeness
7. Data size is 32 bytes~1408 bytes, default is 112 bytes.

Pic 3. SPI packet format

# Header

**Command Header:** Master to ECM-XF packet header

Packet Start Word 0xA1A2A3A4				0x00
3	2	1	0	
Parametric data 3	Parametric data 2	Parametric data 1	Parametric data 0	0x04
<b>Index</b>	Control Word	Reserved		0x08
Data Length		Command Parameter	<b>Command Code</b>	0x0c
Interrupt Clear				0x10
GPIO Output 1	GPIO Output 0	GPIO Interrupt Clear 1	GPIO Interrupt Clear 0	0x14

Pic 4 Command Header

**Response Header:** The header from ECM-XF to master

Packet Start Word 0xA1A2A3A4				0x00
3	2	1	0	
RxPDO waiting to transmit quantity	TxPDO waiting to receive quantity	WKC Error Count	CRC Error Count	0x04
<b>Return Index</b>	ECM Status	ECM Error Status	ECAT State	0x08
Data Length		Return Value	<b>Return Command Code</b>	0x0c
Interrupt Flag				0x10
GPIO Input 1	GPIO Input 0	GPIO Interrupt Flag 1	GPIO Interrupt Flag 0	0x14

System or Hardware relating

Error State

## Header Column Explanation

Table 1. Header column in command packet

Command Header			
Location	Length	Name	Description
0x00	4	Packet Start Word	Fixed Value(0xA1A2A3A4)
0x04	1	Parametric Data 0	Transmit command parameter or data
0x05	1	Parametric Data 1	Transmit command parameter or data
0x06	1	Parametric Data 2	Transmit command parameter or data
0x07	1	Parametric Data 3	Transmit command parameter or data
0x08	2	Reserved	
0x0A	1	Control Word	Control or erase system interrupt event bit0: Valid header IO output column bit3: Erase FIFO error bit4: Erase SPI communication error bit5: Erase SPI CRC error bit6: Erase blocking command bit7: Erase non-blocking command
0x0B	1	Index	Identify main application
0x0C	1	Command Code	Refer to command table
0x0D	1	Command Parameter	command parameter
0x0E	2	Data Length	command parameter or data transmission

0x10	4	Interrupt Clear	Bit 31 : EtherCAT package interrupt clear Bit 29 : Encoder interrupt clear Bit 0-28, 30 : Reserve
0x14	1	GPIO Interrupt Clear 0	Clear GPIO low level interrupt flag
0x15	1	GPIO Interrupt Clear 1	Clear GPIO high level interrupt flag
0x16	1	GPIO output 0	GPIO low level output value
0x17	1	GPIO output 1	GPIO high level output value

Table 2. Header column in return packet

<b>Return Header</b>			
Location	Length	Name	Description
0x00	4	Packet Start Word	Fixed value(0xA1A2A3A4)
0x04	1	CRC Error Count	Number of CRC error count in SPI communication
0x05	1	WKC Error Count	Number of working count error in PDO communication
0x06	1	Number of TxPdoFIFO	Number of TxPDO which are not received in FIFO
0x07	1	Number of RxPdoFifo	Number of RxPDO which are not received in FIFO
0x08	1	ECAT state	0x00 : NONE(non initialize state) 0x01 : INIT(initialized state) 0x02 : PRE_OP(pre-operate state) 0x03 : BOOT(boot state) 0x04 : SAFE_OP(safe operate state) 0x08 : OPERATIONAL(operation state) 0x10 : ERROR(error state)
0x09	1	Error Status	bit0: Check the connect between RJ45 and ECM-XF PIN52 LINK(hardware)

			<p>(1: Linked, 0: unlinked)  bit1: Check the connect between RJ45 and PIN52 by software when operating Ecat_Init()(software)  (1: Linked, 0: unlinked)  bit2: Reserved  bit3: blocking command return error  bit5: FIFO error  bit6: SPI CRC error  bit7: blocking command busy  ※Only a blocking command can be operated at the same period. If bit7 is high and continues to send another blocking command. The bit3 error will pop out. The non-blocking commands are okay to send when the blocking command is operating.</p>
0x0A	1	ECM Status	<p>bit1-bit0 : 0 : fixed value check  1: CRC8 check  2: CRC-CCITT check  3: CRC32 check  bit2 : DC cycle time stable flag  bit3 : ethernet initialized flag  bit4 : ECAT PDO configured flag  bit5 : return packet is NOP flag  bit6 : FIFO enable flag  bit7 : blocking time command busy flag</p>
0x0B	1	Index	Return command header index
0x0C	1	Command Code	Return command header command code
0x0D	1	Command Return Value	Return value from return command
0x0E	2	Data length	command parameter or data valid length
0x10	4	Interrupt flag	<p>Bit 31 : EtherCAT package interrupt flag  Bit 29 : encoder interrupt flag  Bit 0-28, 30 : Reserve</p>
0x14	1	GPIO interrupt flag 0	GPIO low level interrupt flag
0x15	1	GPIO interrupt flag 1	GPIO high level interrupt flag
0x16	1	GPIO input 0	GPIO low level input value
0x17	1	GPIO input 1	GPIO high level input value

# Command Code Table

Commands are divided into two types by response time.

1. NON-BLOCKING - Received commands and operate immediately and return parameters or values.
2. BLOCKING - Received commands and wait a period time to operate and return parameters or values.
3. ECM-XF can only operate a blocking command once. Check the blocking command busy flag of ECM state is zero before transmitting the next blocking command.
4. When blocking command operates, transmitting non-blocking command and other operations is allowed.

**Please refer to Pic 6 Command and Return flowchart diagram**

Table 3. Command Table

Blocking Command	Non-blocking Command
ECM_CMD_ECAT_INIT_OP ECM_CMD_ECAT_RECONFIG_OP ECM_CMD_ECAT_DCSYNC ECM_CMD_ECAT_PDO_CONFIG_SET ECM_CMD_ECAT_STATE_SET	ECM_CMD_INFO_UPDATE_OP ECM_CMD_FW_VERSION_GET ECM_CMD_ECAT_PDO_DATA_FIFO_OP ECM_CMD_ECAT_PDO_DATA_OP ECM_CMD_ECAT_STATE_GET ECM_CMD_ECAT_PDO_WC_GET ECM_CMD_ECAT_SLV_INFO_GET ECM_CMD_ECAT_SLV_CNT_GET ECM_CMD_FIFO_ENABLE ECM_CMD_FIFO_PACK_SIZE_GET ECM_CMD_SPI_PACK_SIZE_GET ECM_CMD_SPI_RECONFIG_OP ECM_CMD_CRC_ERR_CNT_CLR ECM_CMD_CRC_TYPE_SET ECM_CMD_402_CONFIG_SET ECM_CMD_402_STATE_SET ECM_CMD_402_STATE_GET ECM_CMD_402_CTL_SET ECM_CMD_402_CTL_GET
ECM_CMD_ECAT_PDO_CONFIG_REQ ECM_CMD_ECAT_SDO_REQ ECM_EEPROM_REQ	ECM_CMD_ECAT_PDO_CONFIG_GET ECM_CMD_ECAT_SDO_GET ECM_EEPROM_GET

Table 4. Command Description

<a href="#"><u>ECM_CMD_INFO_UPDATE_OP</u></a>	Refresh header data
<a href="#"><u>ECM_CMD_ECAT_INIT_OP</u></a>	Initialize EtherCAT network and slaves before EtherCAT application
<a href="#"><u>ECM_CMD_ECAT_RECONFIG_OP</u></a>	After configuring PDO, reconfiguring memory size for ECM-XF
<a href="#"><u>ECM_CMD_ECAT_PDO_WC_GET</u></a>	Read the slaves quantity of the PDO data contents outputs/inputs or working counter value.
<a href="#"><u>ECM_CMD_ECAT_PDO_DATA_FIFO_OP</u></a>	Access PDO data to FIFO
<a href="#"><u>ECM_CMD_ECAT_PDO_DATA_OP</u></a>	Access PDO data
<a href="#"><u>ECM_CMD_ECAT_PDO_CONFIG_SET</u></a>	Configure PDO slaves
<a href="#"><u>ECM_CMD_ECAT_PDO_CONFIG_REQ</u></a>	Request PDO configuration read. Use ECM_CMD_PDO_CONFIG_GET to return configuration.
<a href="#"><u>ECM_CMD_ECAT_PDO_CONFIG_GET</u></a>	Read PDO slave configuration.
<a href="#"><u>ECM_CMD_ECAT_SDO_REQ</u></a>	Request operating SDO write/read commands. Use ECM_CMD_ECAT_SDO_GET to read return data
<a href="#"><u>ECM_CMD_ECAT_SDO_GET</u></a>	Return ECM_CMD_ECAT_SDO_REQ data
<a href="#"><u>ECM_CMD_ECAT_STATE_SET</u></a>	Set EtherCAT state
<a href="#"><u>ECM_CMD_ECAT_STATE_GET</u></a>	Return EtherCAT state
<a href="#"><u>ECM_CMD_ECAT_SLV_INFO_GET</u></a>	Read slaves information
<a href="#"><u>ECM_CMD_ECAT_SLV_CNT_GET</u></a>	Read slave quantity
<a href="#"><u>ECM_CMD_FIFO_ENABLE</u></a>	Enable RxDPO output. ECM-XF enables

	RxPDO FIFO by default. Use this command can disable RxPDO FIFO manually and pre-save output.
<a href="#">ECM_CMD_FIFO_PACK_SIZE_GET</a>	Read PDO data length, a PDO counts one in FIFO
<a href="#">ECM_CMD_SPI_PACK_SIZE_GET</a>	Read SPI data packet length
<a href="#">ECM_CMD_SPI_RECONFIG_OP</a>	Reset SPI data packet length
<a href="#">ECM_CMD_CRC_ERR_CNT_CLR</a>	Erase CRC error counter
<a href="#">ECM_CMD_CRC_TYPE_SET</a>	Set checking type
<a href="#">ECM_CMD_402_CONFIG_SET</a>	Assign slaves control word and status word offset
<a href="#">ECM_CMD_402_STATE_SET</a>	Switch 402 state of assigned slaves
<a href="#">ECM_CMD_402_STATE_GET</a>	Read 402 state of assigned slaves
<a href="#">ECM_CMD_402_CTL_SET</a>	Set control byte in ECM-XF internal 402 state
<a href="#">ECM_CMD_402_CTL_GET</a>	Read control byte in ECM-XF internal 402 state
<a href="#">ECM_GPIO_CONFIG_SET</a> (ECM_GpioSetMode)	Set GPIO mode
<a href="#">ECM_GPIO_CONFIG_SET</a> (ECM_GpioEnableDebounce)	Enable/disable GPIO debounce
<a href="#">ECM_GPIO_CONFIG_SET</a> (ECM_GpioSetDebounceClock)	Set debounce clock
<a href="#">ECM_GPIO_CONFIG_SET</a> (ECM_GpioIntEnable)	Enable/Disable GPIO interrupt
<a href="#">ECM_GPIO_CONFIG_SET</a> (ECM_GpioIntClear)	Clear GPIO interrupt flag
<a href="#">ECM_GPIO_FUNC_OP</a> (ECM_GpioSetValue)	Set GPIO value
<a href="#">ECM_GPIO_FUNC_OP</a> (ECM_GpioExtSetValue)	Set GPIO value (Extension function, only work for ver. 9 or later)
<a href="#">ECM_GPIO_FUNC_OP</a> (ECM_GpioGetValue)	Get GPIO value

<a href="#">ECM_GPIO_FUNC_OP</a> (ECM_GpioExtGetValue)	Get GPIO value (Extension function, only work for ver. 9 or later)
<a href="#">ECM_GPIO_FUNC_OP</a> (ECM_GpioGetIntFlag)	Get GPIO Interrupt flag
<a href="#">ECM_GPIO_FUNC_OP</a> (ECM_GpioExtGetIntFlag)	Get GPIO Interrupt flag (Extension function, only work for ver. 9 or later)
<a href="#">ECM_QEI_FUNC_OP</a> (ECM_EncOpen)	Open and set encoder mode
<a href="#">ECM_QEI_FUNC_OP</a> (ECM_EncStart)	Start encoder counting
<a href="#">ECM_QEI_FUNC_OP</a> (ECM_EncStop)	Stop encoder counting
<a href="#">ECM_QEI_FUNC_OP</a> (ECM_EncGetCount)	Get encoder counter value
<a href="#">ECM_DAC_FUNC_OP</a> (ECM_DacOpen)	Open DAC function
<a href="#">ECM_DAC_FUNC_OP</a> (ECM_DacClose)	Close DAC function
<a href="#">ECM_DAC_FUNC_OP</a> (ECM_DacSetDelayTime)	Set DAC delay time
<a href="#">ECM_DAC_FUNC_OP</a> (ECM_DacSetData)	Set DAC data
<a href="#">ECM_DAC_FUNC_OP</a> (ECM_DacStartConv)	Start DAC conversion
<a href="#">ECM_ADC_FUNC_OP</a> (ECM_AdcOpen)	Open ADC function
<a href="#">ECM_ADC_FUNC_OP</a> (ECM_AdcClose)	Close ADC function
<a href="#">ECM_ADC_FUNC_OP</a> (ECM_AdcConfigSampleModule)	Configure ADC trigger source
<a href="#">ECM_ADC_FUNC_OP</a> (ECM_AdcGetDataValidFlag)	Get ADC data valid flag
<a href="#">ECM_ADC_FUNC_OP</a>	Start ADC conversion

(ECM_AdcStartConv)	
<a href="#">ECM_ADC_FUNC_OP</a> (ECM_AdcGetConvData)	Get ADC converted data
<a href="#">ECM_EEPROM_REQ</a>	Request EEPROM write/read command. Use ECM_EEPROM_GET to return reading data.
<a href="#">ECM_EEPROM_GET</a>	Read ECM_EEPROM_REQ data
<a href="#">ECM_CMD_ECAT_STATE_CHECK</a>	Reflash and check slaves state
<a href="#">ECM_CMD_ECAT_DCSYNC</a>	Set DC sync signal source, cycle time, and shift time
<a href="#">ECM_CMD_FIFO_CLR_OP</a>	Clear FIFO
<a href="#">ECM_CMD_FIFO_SET_TX_CNT</a>	Set Tx FIFO count
<a href="#">ECM_CMD_FIFO_GET_TX_CNT</a>	Get Tx FIFO count
<a href="#">ECM_CMD_FIFO_SET_RX_CNT</a>	Set Rx FIFO count
<a href="#">ECM_CMD_FIFO_GET_RX_CNT</a>	Get Rx FIFO count
<a href="#">ECM_CMD_FW_VERSION_GET</a>	Read firmware version
<a href="#">ECM_CMD_ECAT_STATE_UPDATE</a>	Update ECAT state
<a href="#">ECM_CMD_ECAT_INT_SET_ENABLE</a>	Set interrupt enable mask
<a href="#">ECM_CMD_ECAT_INT_GET_ENABLE</a>	Get interrupt enable mask

## Command Description

In this section, introducing commands and header relating columns and data content. Please refer to pic 3 to pic 5.

1. Yellow background are command relating, according to command code parametric data
2. Index codes for identify return packet
3. When the command packets have the same index code, the commands will be treated as ECM\_CMD\_INFO\_UPDATE\_OP except the first one.

ECM_CMD_INFO_UPDATE_OP			
Refresh header data			
Command Packet			
Header	1	Command Code	0
	2	Index Code	Custom Defined
	3	Data Length	0

ECM_CMD_ECAT_INIT_OP																													
Initialize EtherCAT network and slaves before EtherCAT application																													
Command Packet																													
Header	1	Command Code	1																										
	2	Index Code	Custom Defined																										
	3	Data Length	16																										
Data Section	1	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td style="text-align: center;">3</td> <td style="text-align: center;">2</td> <td style="text-align: center;">1</td> <td style="text-align: center;">0</td> <td></td> </tr> <tr> <td style="text-align: center;">DC activate</td> <td style="text-align: center;">Reserved</td> <td style="text-align: center;">Reserved</td> <td style="text-align: center;">0</td> <td></td> </tr> <tr> <td colspan="3" style="text-align: center;">Cycle time 0</td> <td style="text-align: center;">4</td> <td></td> </tr> <tr> <td colspan="3" style="text-align: center;">Cycle time 1</td> <td style="text-align: center;">8</td> <td></td> </tr> <tr> <td colspan="3" style="text-align: center;">Time offset</td> <td style="text-align: center;">12</td> <td></td> </tr> </table>		3	2	1	0		DC activate	Reserved	Reserved	0		Cycle time 0			4		Cycle time 1			8		Time offset			12		
		3	2	1	0																								
		DC activate	Reserved	Reserved	0																								
		Cycle time 0			4																								
		Cycle time 1			8																								
Time offset			12																										
Location	Length	Name	Description																										
0x00	1	Reserved	Fixed Value 0xFF																										
0x01	1	Reserved	Fixed Value 0x81 FIFO disabled (default) Enable FIFO after OP state if needed																										

	0x02	2	DC activate	Reference AssignActivate in ESI
	0x04	4	Cycle Time 0	SYNC0 Cycle Time(ns)
	0x08	4	Cycle Time 1	SYNC1 Cycle Time(ns)
	0x12	4	Time Offset	Cycle Time Offset(ns)

**ECM\_CMD\_ECAT\_RECONFIG\_OP**

After configuring PDO, reconfiguring memory size for ECM-XF

**Command Packet**

Header	1	Command Code	2
	2	Index Code	Custom Defined
	3	Data Length	0

**ECM\_CMD\_ECAT\_PDO\_WC\_GET**

Read the slaves quantity of the PDO data contents outputs/inputs or working counter value.

**Command Packet**

Header	1	Command Code	4
	2	Index	Custom Defined
	3	Data Length	0
	4	Command Parameter	1 : Input Slave Quantity 2 : Output Slave Quantity 3 : Working Counter Quantity

**Return Packet**

Header	1	Command Code	4
	2	Index	Same as Command Packet Index
	3	Data Length	4
Data Section	1	Read return quantity value	

Working counter logical value = (input slave quantity)\*1 + (output slave quantity)\*2

ECM\_CMD\_ECAT\_PDO\_DATA\_FIFO\_OP  
Access PDO data to FIFO

Command Packet

Header	1	Command Code	5
	2	Index Code	Custom Defined
	3	Data Length	RxPDO Length
	4	Command Parameter	PDO Data quantity
	5	Command Data 0	Write/Read Operation Code bit 0: Write operation bit 1: Read operation
Data Section	1	PDO Data	RxPDO Data

Return Packet

Header	1	Command Code	5
	2	Index Code	Same as Command Packet Index
	3	Data Length	TxPDO Length
	4	Return Value	Write/Read Operation Code bit 0: Write operation bit 1: Read operation
Data Section	1		TxPDO Data

ECM\_CMD\_ECAT\_PDO\_DATA\_OP  
Access PDO data

Command Packet

Header	1	Command Code	6
	2	Index Code	Custom Defined
	3	Command Parameter	RxPDO Length

	4	Command Data 0	Write/Read Operation Code bit 0: Write operation bit 1: Read operation bit 2: 1 presents operation valid. If bit value is 0, force it operates write and read operation
Data Section	1	RxPDO Data	
Return Packet			
Header	1	Command Code	6
	2	Index Code	Same as Command Packet Index
	3	Data Length	TxPDO Length
	4	Return Value	Write/Read Operation Code bit 0: Write operation bit 1: Read operation bit 2: 1 presents operation valid. If bit value is 0, force it operates write and read operation
Data Section	1	TxPDO Data	

ECM_CMD_ECAT_PDO_CONFIG_SET Set PDO configuration ※This API only allows 3 PDO and 8 objects for each of them. If you need more please use SDO to set the configuration.			
Command Packet			
Header	1	Command Code	7
	2	Index	Custom Defined
	3	Data Length	112

ECM\_CMD\_ECAT\_SDO\_REQ  
Request SDO write/read command.  
Use ECM\_CMD\_ECAT\_SDO\_GET to read return data.

Command Packet

Header	1	Command Code	10			
	2	Index Code	Custom Defined			
	3	Data Length	Read Operation : 12 Write Operation : 12+ Valid command data			
Data Section	1					
		3	2	1	0	
		Index Code		Slave Number	Operation Code	0
		Data Length		Reserved	Sub-index Code	4
		Operation Timeout				8
Data				12		
		Location	Length	Name	Description	

	0x00	1	Operation Code	0:Write Operation 1:Read Operation
	0x01	1	Slave Number	0~127
	0x02	2	Index	CoE Object Index
	0x04	1	Sub-index	CoE Object Sub-index
	0x05	1	Reserved	
	0x06	2	Data Length	Valid Write Operation, Valid Command Length
	0x08	4	Timeout	SDO Maximum Timeout( $\mu$ s)
	0x12	256	Data	Valid Write Operation

ECM_CMD_ECAT_SDO_GET Read the result from ECM_CMD_ECAT_SDO_REQ				
Command Packet				
Header	1	Return Code	11	
	2	Index Code	Custom Defined	
	3	Data Length	0	
Return Packet				
Header	1	Command Code	11	
	2	Index Code	Same as Command Packet Index	
	3	Data Length	Valid Data Length	
Data Section	1	Last ECM_CMD_ECAT_SDO_REQ Read Data		

ECM_CMD_ECAT_STATE_SET Set EtherCAT state				
Command Packet				
Header	1	Command Code	12	

	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	Slave Number 0xFF: All slaves
	5	Command Data 0	EtherCAT State

ECM_CMD_ECAT_STATE_GET Return EtherCAT state			
Command Packet			
Header	1	Command Code	13
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	Slave Number 0xFF: All slaves
Return Packet			
Header	1	Command Code	13
	2	Index Code	Same as Command Packet Index
	3	Data Length	0
	4	Return Value	EtherCAT State

ECM_CMD_ECAT_SLV_INFO_GET Read Slave Information			
Command Packet			
Header	1	Command Code	15
	2	Index	Custom Defined
	3	Data Length	0
	4	Command Parameter	Slave Number (The 1st one would be 0)

	5	Command Data 0	Slave Information Code 0 : Manufacturer Code 1 : Manufacturer Product Number 2 : Version Number 3 : Product Name 4 : Configuration Location 5 : Location Alias 6 : State 7 : AL state 8 : Output Data Length 9 : Input Data Length
--	---	----------------	--

Return Packet

Header	1	Command Code	15
	2	Index	Same as Command Packet Index
	3	Data Length	Slave Information Data Length
Data Section	1	Slave Information	

ECM\_CMD\_ECAT\_SLV\_CNT\_GET  
Read slave quantity

Command Packet

Header	1	Command Code	16
	2	Index Code	Custom Defined
	3	Data Length	0

Return Packet

Header	1	Command Code	16
	2	Index Code	Same as Command Packet Index
	3	Data Length	0
	4	Return Value	Slave quantity

ECM\_CMD\_FIFO\_ENABLE

Enable RxPDO output. ECM-XF enables RxPDO FIFO by default. Use this command can disable RxPDO FIFO manually and pre-save output.

Command Packet

Header	1	Command Code	18
	2	Index	Custom Defined
	3	Data Length	0
	4	Command Parameter	0 : Disable 1 : Enable

ECM\_CMD\_FIFO\_PACK\_SIZE\_GET

Read PDO data length, a PDO counts 1 in FIFO.

Command Packet

Header	1	Command Code	19
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	0 : Read RxPDO Data Length 1 : Read TxPDO Data Length

Return Packet

Header	1	Command Code	19
	2	Index	Same as Command Packet Index
	3	Data Length	2
Data Section	1	PDO Data Length	

ECM\_CMD\_SPI\_PACK\_SIZE\_GET

Read SPI data packet length

Command Packet

Header	1	Command Code	20
--------	---	--------------	----

	2	Index Code	Custom Defined
	3	Data Length	0
Return Packet			
Header	1	Command Code	20
	2	Index Code	Same as Command Packet Index
	3	Data Length	2
Data Section	1		SPI data length

ECM_CMD_SPI_RECONFIG_OP Reset SPI data packet length			
Command Packet			
Header	1	Command Code	23
	2	Index Code	Custom Defined
	3	Data Length	SPI packet data length(32 ~ 1408)
Return Packet			
Header	1	Command Code	23
	2	Index Code	Same as Command Packet Index
	3	Data Length	0

ECM_CMD_CRC_ERR_CNT_CLR Erase CRC error check count			
Command Packet			
Header	1	Command Code	24
	2	Index	Custom Defined
	3	Data Length	0
Return Packet			

Header	1	Command Code	24
	2	Index	Same as Command Packet Index
	3	Data Length	0
	4	Return Value	Erase the number of CRC error counting

ECM\_CMD\_CRC\_TYPE\_SET  
Set checking type

Command Code

Header	1	Command Code	25
	2	Index	Custom Defined
	3	Data Length	0
	4	Data Parameter	<p>0 : Fixed Value Check: 0x12345678</p> <p>1 : CRC-8: <math>X^8 + X^2 + X + 1</math> (Poly = 0x07) Init = 0x00, RefIn = False, RefOut = False, XorOut = 0x00</p> <p>2 : CRC-CCITT-FALSE: <math>X^{16} + X^{12} + X^5 + 1</math> (Poly = 0x1021) Init = 0xFFFF, RefIn = False, RefOut = False, XorOut = 0x0000</p> <p>3 : CRC-32: <math>X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1</math> Init = 0xFFFFFFFF, RefIn = True, RefOut = True, XorOut = 0xFFFFFFFF</p>

ECM\_CMD\_402\_CONFIG\_SET

Assign slave control word and status word offset

Command Packet

Header	1	Command Code	26
	2	Index	Custom Defined
	3	Data Length	0

	4	Command Parameter	Motor Number(The 1st one would be 0)
	5	Command Data 0	Control Word Offset(Byte)
	6	Command Data 1	Status Word Offset(Byte)
	7	Command Data 2	Set control bytes of ECM-XF internal 402 state bit3 : Erase slave state error bit4 : Enable state machine bit7 : Enable automatic erasing slave state machine error Enable this function will control the axis control word automatically to achieve 402 state machine switching, fault reset ,etc. bit3 with 1 presents single fault reset, bit 4 with 1 presents enable, and bit 7 with 1 present automatic continuing fault reset
	8	Command Data 3	Slave Number (The 1st one would be 0)

ECM_CMD_402_STATE_SET Switch assigned slave 402 state			
Command Packet			
Header	1	Command Code	27
	2	Index	Custom Defined
	3	Data Length	0
	4	Parameter	Motor Number(The 1st one would be 0)
	5	Parametric Data	402 State NOT READY TO SWITCH ON    0x00 SWITCHED ON DISABLED       0x40 READY TO SWITCH ON         0x21 SWITCHED ON                 0x23 OPERATION ENABLED         0x27 QUICK STOP ACTIVE         0x07 FAULT REACTION ACTIVE     0x0F FAULT                         0x08

ECM_CMD_402_STATE_GET Read assigned slave 402 state	
--	--

Command Packet			
Header	1	Command Code	28
	2	Index	Custom Defined
	3	Data Length	0
	4	Command Parameter	Motor Number(The 1st one would be 0)
Return Packet			
Header	1	Command Code	28
	2	Index	Same as Command Packet Index
	3	Data Length	0
	4	Return Value	Slave current 402 State

ECM_CMD_402_CTL_SET Set control bytes of ECM-XF internal 402 state			
Command Packet			
Header	1	Command Code	29
	2	Index	Custom Defined
	3	Data Length	0
	4	Command Parameter	Motor Number(The 1st one would be 0)
	5	Parametric Data 0	bit3 : Erase slave state error bit4 : Enable state machine bit7 : Enable automatic erasing slave state machine error

ECM_CMD_402_CTL_GET Read control bytes of ECM-XF internal 402 state			
Command Packet			
Header	1	Command Code	30

	2	Index	Custom Defined
	3	Data Length	0
	4	Command Parameter	Motor Number(The 1st one would be 0)
Return Packet			
Header	1	Command Code	30
	2	Index	Same as Command Packet Index
	3	Data Length	0
	4	Return Value	Set value of 402 state machine

ECM_GPIO_CONFIG_SET(ECM_GpioSetMode) Set GPIO mode			
Command Packet			
Header	1	Command Code	31
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	0
	5	Command Data 0	Bit n: 1 for setting GPIO mode of GPIO <sub>n</sub> (n =0 to 7)
	6	Command Data 1	Bit n: 1 for setting GPIO mode of GPIO <sub>n+8</sub> (n =0 to 7)
	7	Command Data 2	GPIO mode definition 0x0: Input Mode 0x1: Output Mode 0x2: Open-Drain Mode 0x3: Quasi-bidirectional Mode
	8	Command Data 3	GPIO pull select definition 0x0: Pull Select Disable Mode 0x1: Pull-up Mode 0x2: Pull-down Mode

ECM\_GPIO\_CONFIG\_SET(ECM\_GpioSetMode)  
 Set GPIO mode  
 (GPIO Extension function, only work for ver. 9 or later)

Command Packet

Header	1	Command Code	31
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	8
	5	Command Data 0	Bit n: 1 for setting GPIO mode of GPIO <sub>n</sub> +16 (n = 0 to 3)
	6	Command Data 1	Reserved, set 0.
	7	Command Data 2	GPIO mode definition 0x0: Input Mode 0x1: Output Mode 0x2: Open-Drain Mode 0x3: Quasi-bidirectional Mode
	8	Command Data 3	GPIO pull select definition 0x0: Pull Select Disable Mode 0x1: Pull-up Mode 0x2: Pull-down Mode

ECM\_GPIO\_CONFIG\_SET(ECM\_GpioEnableDebounce)  
 Enable/disable GPIO debounce

Command Packet

Header	1	Command Code	31
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	2
	5	Command Data 0	Bit n: 1 for enable GPIO debounce of GPIO <sub>n</sub> , 0 for disable debounce of GPIO <sub>n</sub> .

			(n =0 to 7)
	6	Command Data 1	Bit n: 1 for enable GPIO debounce of GPIO <sub>n</sub> +8, 0 for disable debounce of GPIO <sub>n</sub> +8. (n =0 to 7)
	7	Command Data 2	IO direction 0: disable 1: enable
	8	Command Data 3	Reserved

ECM\_GPIO\_CONFIG\_SET(ECM\_GpioEnableDebounce)  
 Enable GPIO debounce  
 (GPIO Extension function, only work for ver. 9 or later)

Command Packet

Header	1	Command Code	31
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	9
	5	Command Data 0	Bit n: 1 for enable GPIO debounce of GPIO <sub>n</sub> +16; 0 for disable debounce of GPIO <sub>n</sub> +16. (n =0 to 3)
	6	Command Data 1	Reserved, set 0.
	7	Command Data 2	IO direction 0: disable 1: enable
	8	Command Data 3	Reserved

ECM\_GPIO\_CONFIG\_SET(ECM\_GpioSetDebounceClock)  
 Set debounce clock

Command Packet

Header	1	Command	31
--------	---	---------	----

		Code	
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	3
	5	Command Data 0	<p>Bit 0 to 3: Debounce clock cycle. The valid value is 0 to 15.</p> <p>Bit 4: Clock source 0: 192M 1: 10K</p> <p>The sampling cycle is <math>2^{(Debounce\ clock\ cycle)} * (clock\ period)</math></p>

ECM\_GPIO\_CONFIG\_SET(ECM\_GpioIntEnable)  
Enable/Disable GPIO interrupt

Command Packet

Header	1	Command Code	31
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	1
	5	Command Data 0	Channels From 0 to 20
	6	Command Data 1	<p>Interrupt type</p> <p>0x0: Disable Interrupt 0x1: Interrupt enable by Rising Edge or Falling Edge 0x2: Interrupt enable by Input Falling Edge 0x3: Interrupt enable by Input Rising Edge</p>

ECM\_GPIO\_CONFIG\_SET(ECM\_GpioIntClear)  
Clear GPIO interrupt flag

Command Packet

Header	1	Command Code	31
--------	---	--------------	----

	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	4
	5	Command Data 0	Bit n: clear GPIO <sub>n</sub> interrupt flag (n =0 to 7)
	6	Command Data 1	Bit n: clear GPIO <sub>n+8</sub> interrupt flag (n =0 to 7)

ECM\_GPIO\_CONFIG\_SET(ECM\_GpioIntClear)  
Clear GPIO interrupt flag  
(GPIO Extension function, only work for ver. 9 or later)

Command Packet

Header	1	Command Code	31
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	6
	5	Command Data 0	Bit n: clear GPIO <sub>n</sub> interrupt flag (n =0 to 7)
	6	Command Data 1	Bit n: clear GPIO <sub>n+8</sub> interrupt flag (n =0 to 7)
	7	Command Data 2	Bit n: clear GPIO <sub>n+16</sub> interrupt flag (n =0 to 3)

ECM\_GPIO\_FUNC\_OP(ECM\_GpioSetValue)  
Set GPIO value

Command Packet

Header	1	Command Code	32
	2	Index Code	Custom Defined
	3	Data Length	0

	4	Command Parameter	0
	5	Command Data 0	Bit n: 1 for setting GPIO <sub>n</sub> to high, 0 for setting GPIO <sub>n</sub> to low. (n =0 to 7)
	6	Command Data 1	Bit n: 1 for setting GPIO <sub>n+8</sub> to high, 0 for setting GPIO <sub>n+8</sub> to low. (n =0 to 7)

ECM\_GPIO\_FUNC\_OP(ECM\_GpioExtSetValue)  
Set GPIO value  
(Extension function, only work for ver. 9 or later)

Command Packet

Header	1	Command Code	32
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	2
	5	Command Data 0	Bit n: 1 for setting GPIO <sub>n</sub> to high, 0 for setting GPIO <sub>n</sub> to low. (n =0 to 7)
	6	Command Data 1	Bit n: 1 for setting GPIO <sub>n+8</sub> to high, 0 for setting GPIO <sub>n+8</sub> to low. (n =0 to 7)
	7	Command Data 2	Bit n: 1 for setting GPIO <sub>n+16</sub> to high, 0 for setting GPIO <sub>n+16</sub> to low. (n =0 to 3)

ECM\_GPIO\_FUNC\_OP(ECM\_GpioGetValue)  
Get GPIO value

Command Packet

Header	1	Command Code	32
	2	Index Code	Custom Defined

	3	Data Length	0
	4	Command Parameter	1
Return Packet			
Header	1	Command Code	32
	2	Index Code	Custom Defined
	3	Data Length	2
Data Section			Bit n: 1 if GPIO <sub>n</sub> is in input mode and the input is high; 0 if GPIO <sub>n</sub> is in input mode and the input is low. (n =0 to 15)

ECM_GPIO_FUNC_OP(ECM_GpioExtGetValue) Get GPIO value (Extension function, only work for ver. 9 or later)			
Command Packet			
Header	1	Command Code	32
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	3
Return Packet			
Header	1	Command Code	32
	2	Index Code	Custom Defined
	3	Data Length	4
Data Section			Bit n: 1 if GPIO <sub>n</sub> is in input mode and the input is high; 0 if GPIO <sub>n</sub> is in input mode and the input is low. (n =0 to 19)

ECM_GPIO_FUNC_OP(ECM_GpioGetIntFlag) Get GPIO Interrupt flag			
---	--	--	--

Command Packet			
Header	1	Command Code	32
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	5
Return Packet			
Header	1	Command Code	32
	2	Index Code	Custom Defined
	3	Data Length	2
Data Section			Bit n: GPIO n interrupt flag (n = 0 to 15)

ECM_GPIO_FUNC_OP(ECM_GpioExtGetIntFlag) Get GPIO Interrupt flag (Extension function, only work for ver. 9 or later)			
Command Packet			
Header	1	Command Code	32
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	7
Return Packet			
Header	1	Command Code	32
	2	Index Code	Custom Defined
	3	Data Length	4
Data Section			Bit n: GPIO n interrupt flag (n = 0 to 19)

ECM_QEI_FUNC_OP(ECM_EncOpen) Open and set encoder mode			
Command Packet			
Header	1	Command Code	33
	2	Index Code	Custom Defined
	3	Data Length	4
	4	Command Parameter	4
Data Section			<p style="text-align: right;">Mode</p> 0x000: X4 free-counting Mode 0x100: X2 free-counting Mode 0x200: X4 compare-counting Mode 0x300: X2 compare-counting Mode

ECM_QEI_FUNC_OP(ECM_EncStart) Start encoder counting			
Command Packet			
Header	1	Command Code	33
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	5

ECM_QEI_FUNC_OP(ECM_EncStop) Stop encoder counting			
Command Packet			
Header	1	Command Code	33
	2	Index Code	Custom Defined
	3	Data Length	0

	4	Command Parameter	6
--	---	-------------------	---

ECM_QEI_FUNC_OP(ECM_EncGetCount) Get encoder counter value			
Command Packet			
Header	1	Command Code	33
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	21
Return Packet			
Header	1	Command Code	33
	2	Index Code	Custom Defined
	3	Data Length	4
Data Section			Encoder data

ECM_DAC_FUNC_OP(ECM_DacOpen) Open DAC function			
Command Packet			
Header	1	Command Code	34
	2	Index Code	Custom Defined
	3	Data Length	4
	4	Command Parameter	20
Data Section	5	Data	<p>Mode</p> <p>0x0000: Use ECM_DacSetData() function to trigger DAC output.</p> <p>0x0010: Use ECM_DacStartConv() function to trigger DAC output.</p> <p>0x0030: DAC is triggered if DAC_ST pin is low.</p>

			<p>0x1030: DAC is triggered if DAC_ST pin is high.  0x2030: DAC is triggered if DAC_ST pin detect a rising edge.  0x3030: DAC is triggered if DAC_ST pin detect a falling edge.</p>
--	--	--	---

ECM_DAC_FUNC_OP(ECM_DacClose) Close DAC function			
Command Packet			
Header	1	Command Code	34
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	21

ECM_DAC_FUNC_OP(ECM_DacSetDelayTime) Set DAC delay time			
Command Packet			
Header	1	Command Code	34
	2	Index Code	Custom Defined
	3	Data Length	4
	4	Command Parameter	22
Data Section		Data	Basically the range of this value is from 0 to 1023.(unit: 1/96 us) Consider that DAC needs at least 8us from 0x000 to 0xFFF, DAC delay time is recommended to be greater than 768.

ECM_DAC_FUNC_OP(ECM_DacSetData) Set DAC data			
Command Packet			
Header	1	Command Code	34
	2	Index Code	Custom Defined

	3	Data Length	4
	4	Command Parameter	11
Data Section		Data	Data value: 0 ~ 4095 corresponding to 0 ~ 3.3V

ECM_DAC_FUNC_OP(ECM_DacStartConv) Start DAC conversion			
Command Packet			
Header	1	Command Code	34
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	0

ECM_ADC_FUNC_OP(ECM_AdcOpen) Open ADC function			
Command Packet			
Header	1	Command Code	35
	2	Index Code	Custom Defined
	3	Data Length	4
	4	Command Parameter	40
Data Section		Data	0x000: single-end mode 0x100: differential mode

ECM_ADC_FUNC_OP(ECM_AdcClose) Close ADC function			
Command Packet			
Header	1	Command Code	35

	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	41

ECM\_ADC\_FUNC\_OP(ECM\_AdcConfigSampleModule)  
Configure ADC trigger source

Command Packet

Header	1	Command Code	35																				
	2	Index Code	Custom Defined																				
	3	Data Length	12																				
	4	Command Parameter	42																				
Data Section		Data	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td style="text-align: center;">3</td> <td style="text-align: center;">2</td> <td style="text-align: center;">1</td> <td style="text-align: center;">0</td> <td></td> </tr> <tr> <td colspan="4" style="text-align: center;">Reserved, set 0</td> <td style="text-align: right;">0x0</td> </tr> <tr> <td colspan="4" style="text-align: center;">0: software trigger</td> <td style="text-align: right;">0x4</td> </tr> <tr> <td colspan="4" style="text-align: center;">Reserved, set 0</td> <td style="text-align: right;">0x8</td> </tr> </table>	3	2	1	0		Reserved, set 0				0x0	0: software trigger				0x4	Reserved, set 0				0x8
3	2	1	0																				
Reserved, set 0				0x0																			
0: software trigger				0x4																			
Reserved, set 0				0x8																			

ECM\_ADC\_FUNC\_OP(ECM\_AdcGetDataValidFlag)  
Get ADC data valid flag

Command Packet

Header	1	Command Code	35
	2	Index Code	Custom Defined
	3	Data Length	4
	4	Command Parameter	17
Data Section		Data	Reserved, set 0x1000.

Return Packet			
Header	1	Command Code	35
	2	Index Code	Custom Defined
	3	Data Length	4
Data Section			Valid flag. The convert data is valid if and only if the valid flag is non-zero.

ECM_ADC_FUNC_OP(ECM_AdcStartConv) Start ADC conversion			
Command Packet			
Header	1	Command Code	35
	2	Index Code	Custom Defined
	3	Data Length	4
	4	Command Parameter	12
Data Section			Reserved, set 0x1000.

ECM_ADC_FUNC_OP(ECM_AdcGetConvData) Get ADC converted data			
Command Packet			
Header	1	Command Code	35
	2	Index Code	Custom Defined
	3	Data Length	4
	4	Command Parameter	15
Data Section			Reserved, set 12.
Return Packet			

Header	1	Command Code	35
	2	Index Code	Custom Defined
	3	Data Length	4
Data Section			Convert data. 0 ~ 4095 corresponding to 0 ~ 3.3V

ECM_EEPROM_REQ																			
Request execute EEPROM write/read order																			
Use ECM_EEPROM_GET to read return data from ECM_EEPROM_REQ																			
Command Packet																			
Header	1	Command Code	38																
	2	Index	Custom Defined																
	3	Data Length	12																
Data Section	1	<table border="1" style="width: 100%; text-align: center;"> <tr> <td style="width: 25%;">3</td> <td style="width: 25%;">2</td> <td style="width: 25%;">1</td> <td style="width: 25%;">0</td> </tr> <tr> <td>Slave Number</td> <td>Operation Code</td> <td colspan="2">0</td> </tr> <tr> <td>Write Data</td> <td>Write/Read Location</td> <td colspan="2">4</td> </tr> <tr> <td colspan="3">Timeout</td> <td>8</td> </tr> </table>		3	2	1	0	Slave Number	Operation Code	0		Write Data	Write/Read Location	4		Timeout			8

		0x06	2	Write Data	Valid Write Operation														
0x08	4	Timeout	Maximum Timeout(μs)																

ECM_EEPROM_GET Read result from ECM_EEPROM_REQ command			
Command Packet			
Header	1	Command Code	39
	2	Index	Custom Defined
	3	Data Length	0
Return Packet			
Header	1	Command Code	39
	2	Index	Same as Command Packet Index
	3	Data Length	Valid Data Section Length
	4	Return Value	Operation Error Code
Data Section	1	Get ECM_EEPROM_REQ data back	

ECM_CMD_ECAT_STATE_CHECK Reflash and check slave state			
Command Packet			
Header	1	Command Code	41
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	Slave Number 0xFF: All slaves
	5	Command Data 0	EtherCAT State

ECM_CMD_ECAT_DCSYNC Set DC sync signal source, cycle time, and shift time			
Command Packet			
Header	1	Command	50

		Code																										
	2	Index Code	Custom Defined

Return Packet

Header	1	Command Code	50
	2	Index Code	Same as Command Packet Index
	3	Data Length	0

ECM\_CMD\_FIFO\_CLR\_OP  
Clear FIFO

Command Packet

Header	1	Command Code	51
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	0: Clear both TxFIFO and RxFIFO 1: Clear TxFIFO only 2: Clear RxFIFO only

ECM\_CMD\_FIFO\_SET\_TX\_CNT  
Set Tx FIFO count

Command Packet

Header	1	Command Code	52
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	Tx FIFO count

ECM_CMD_FIFO_GET_TX_CNT Get Tx FIFO count			
Command Packet			
Header	1	Command Code	53
	2	Index Code	Custom Defined
	3	Data Length	0
Return Packet			
Header	1	Command Code	53
	2	Index	Custom Defined
	3	Data Length	0
	4	Return	Tx FIFO count

ECM_CMD_FIFO_SET_RX_CNT Set Rx FIFO count			
Command Packet			
Header	1	Command Code	54
	2	Index Code	Custom Defined
	3	Data Length	0
	4	Command Parameter	Rx FIFO count

ECM_CMD_FIFO_GET_RX_CNT Get Tx FIFO count			
Command Packet			
Header	1	Command Code	55
	2	Index Code	Custom Defined
	3	Data Length	0
Return Packet			
Header	1	Command Code	55
	2	Index	Custom Defined
	3	Data Length	0
	4	Return	Rx FIFO count

ECM_CMD_FW_VERSION_GET Read firmware version			
Command Packet			
Header	1	Command Code	56
	2	Index	Custom Defined
	3	Data Length	0
Return Packet			
Header	1	Command Code	56
	2	Index	Same as Command Packet Index
	3	Data Length	0
	4	Return Value	Firmware Version

ECM_CMD_ECAT_STATE_UPDATE Update ECAT state			
Command Code			

Header	1	Command Code	57
	2	Index	Custom Defined
	3	Data Length	0

ECM\_CMD\_ECAT\_INT\_SET\_ENABLE  
Set interrupt enable mask

Command Code

Header	1	Command Code	58
	2	Index	Custom Defined
	3	Data Length	6
	4	Data Parameter	u8INTActiveHigh : INT0/INT1 interrupt signal polar BIT0 : INT0 signal polar (0 for Active low, others vice versa) BIT1 : INT1 signal polar (0 for Active low, others vice versa)

Data Section	1	<div style="display: flex; justify-content: space-around; width: 100%;"> <span>3</span> <span>2</span> <span>1</span> <span>0</span> </div>

--	---

ECM_CMD_FIFO_INIT			
Initialize FIFO. Construct FIFO memory with FIFO count and PDO data size first.			
Command Packet			
Header	1	Command Code	66
	2	Index	Custom Defined
	3	Data Length	0
Return Packet			
Header	1	Command Code	66
	2	Index	Same as Command Packet Index
	3	Data Length	0

ECM\_CMD\_ECAT\_WKC\_CONTI\_ERR\_MAX\_GET  
 Get EtherCAT working counter error maximum value.

Command Packet

Header	1	Command Code	131
	2	Index	Custom Defined
	3	Data Length	0

Return Packet

Header	1	Command Code	131
	2	Index	Same as Command Packet Index
	3	Data Length	0
	4	Return Value	working counter error maximum value value 255 means infinite

ECM\_CMD\_ECAT\_WKC\_CONTI\_ERR\_MAX\_SET  
 Set EtherCAT working counter error maximum value.

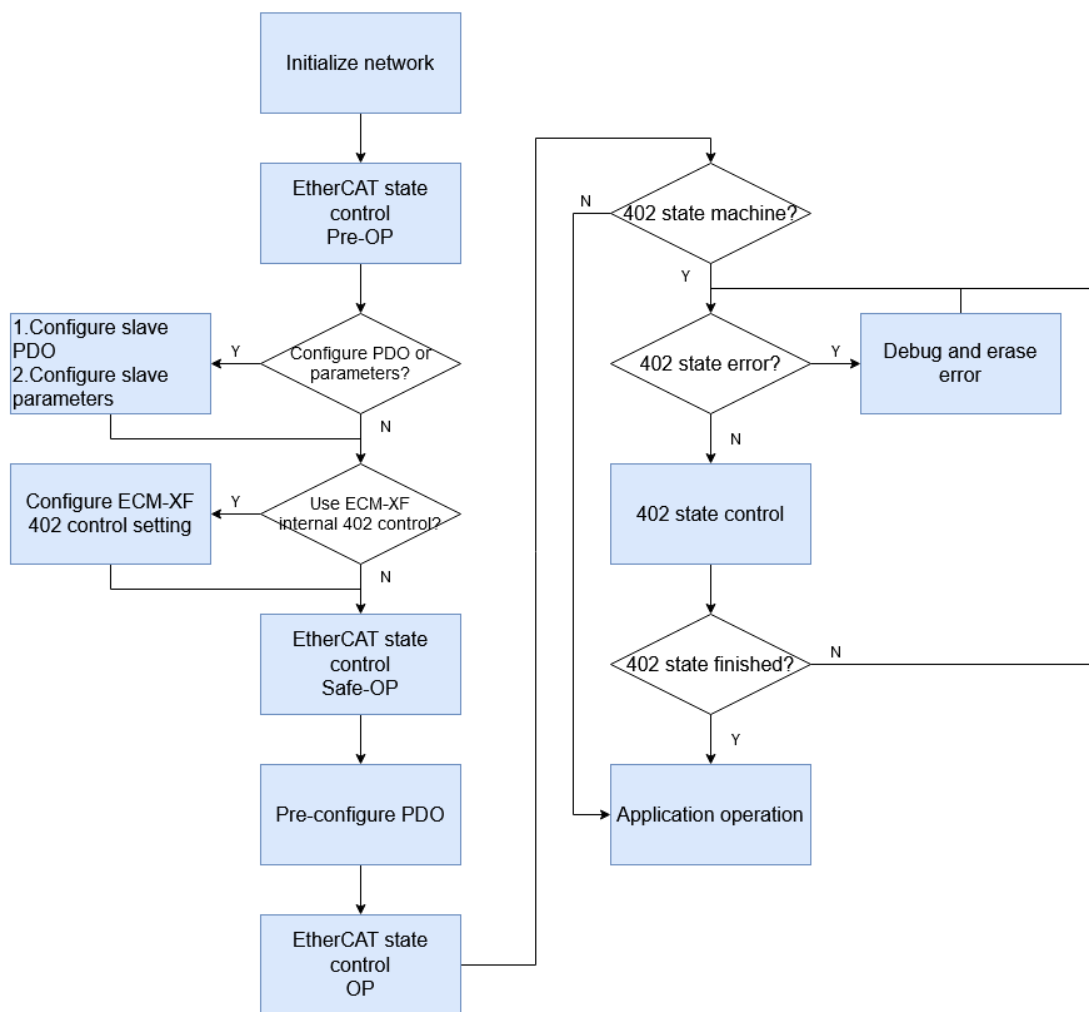

When the value is larger than the setting, PDO data exchange would be terminated and the flag of Error status bit3/bit5 would turn into 0.

Command Packet

Header	1	Command Code	132
	2	Index	Custom Defined
	3	Data Length	0
	4	Parameter	working counter error maximum value default 255(255 means infinite), value range 1~254

## ECM-XF EtherCAT Network Initialization and Slave Configuration

Pic 7. EtherCAT network initialization and configuration diagram

State	Relative Commands	Description
Initialize Network	ECM_CMD_ECAT_INIT_OP	Set DC Mode and Cycle Time
ECAT State Control	ECM_CMD_ECAT_STATE_SET ECM_CMD_ECAT_STATE_GET	Switch to EtherCAT State
Configure slave PDO	ECM_CMD_ECAT_PDO_CONFIG_SET ECM_CMD_ECAT_PDO_CONFIG_REQ ECM_CMD_ECAT_PDO_CONFIG_GET ECM_CMD_ECAT_RECONFIG_OP	Assign or configure PDO
Configure slave parameters	ECM_CMD_ECAT_SDO_REQ ECM_CMD_ECAT_SDO_GET	Use SDO to configure parameters like: control mode, torque limit, etc.
Configure 402 State	ECM_CMD_402_CONFIG_SET	Enable internal 402 control Configure erasing error
402 State Control	ECM_CMD_402_STATE_SET ECM_CMD_402_STATE_GET	Switch 402 state
Preconfigure PDO	ECM_CMD_FIFO_PACK_SIZE_GET ECM_CMD_ECAT_PDO_WC_GET ECM_CMD_ECAT_PDO_DATA_OP	Get PDO Data Size Get PDO communication WKC value Read TxPDO input Initialize RxPDO output
Application Operation	ECM_CMD_ECAT_PDO_DATA_FIFO_OP ECM_CMD_ECAT_SDO_REQ ECM_CMD_ECAT_SDO_GET	PDO data exchange by FIFO Use SDO write/read

	ECM_CMD_INFO_UPDATE_OP	data Reflash state
--	------------------------	-----------------------

## ECM-XF Interrupts

ECM-XF has two interrupt outputs. The INTO pin is low if SPI is ready. Do not transmit/receive SPI if the INTO pin is in high state.

INT1 is a general interrupt function pin. If an interrupt enable bit(with function ECM\_CMD\_ECAT\_INT\_SET\_ENABLE) is set and an interrupt event occurs, the INT1 interrupt is active. Pic 8 shows a scenario where EtherCAT receives events that occur in t=2 and t=7; interrupt mode is low active.

Pic 8. An interrupt example.

INT1 is the hardware signal(ECM-XF PIN 7)

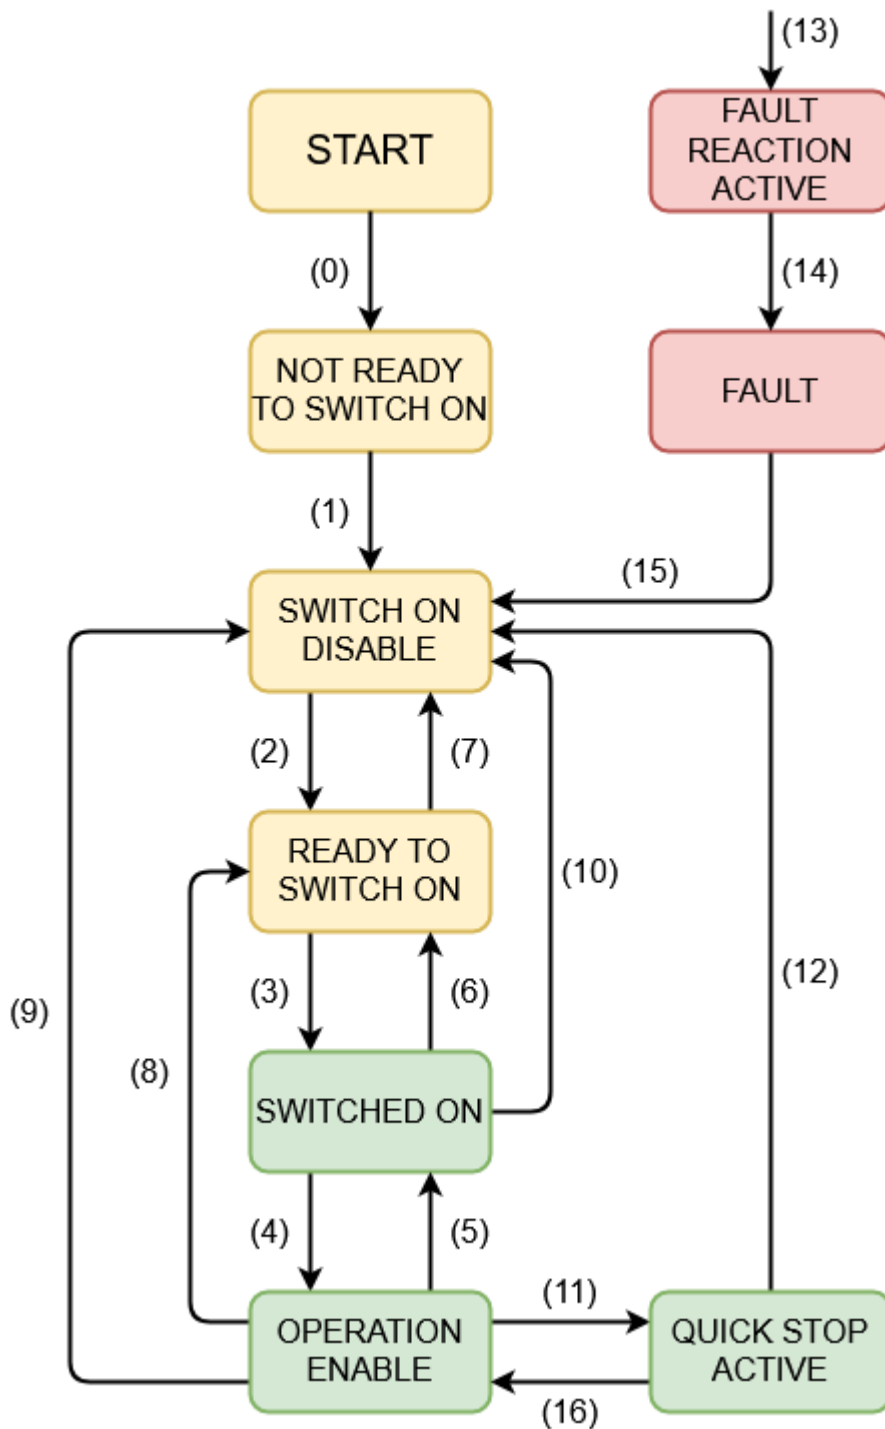

IntEnable is the function ECM\_CMD\_ECAT\_INT\_SET\_ENABLE

IntFlag is the section of the return header(0x10~0x13)

IntClr is the section of the command header(0x10~0x13)

EtherCAT receive events occur in t=2 and t=7. The bit 31 of IntFlag is set in t=2 and t=7, and is reset if the bit 31 of IntClr is set by SPI master. INT1 is active only if both IntFlag and IntEnable are set. In this case, INT1 is active only in t=7.

## Appendix 1. CiA 402 State Machine

Get CiA402 state from transmitting status word(0x0641:0)

Index	Sub	Name	Data Type	Access	PDO Mapping	Default Value
0x6041	00	Status	UINT	RO	Y	*(See

		<b>Word</b>				<b>below)</b>
--	--	-------------	--	--	--	---------------

**Bit 0 to 3 and bit 5 to 6: for the current state of the drive**

<b>Command</b>	<b>bit 6</b>	<b>bit 5</b>	<b>bit 3</b>	<b>bit 2</b>	<b>bit 1</b>	<b>bit 0</b>
<b>Not ready to switch on</b>	0	0	0	0	0	0
<b>Switch on disabled</b>	1	0	0	0	0	0
<b>Ready to switch on</b>	0	1	0	0	0	1
<b>Switched on</b>	0	1	0	0	1	1
<b>Operation enabled</b>	0	1	0	1	1	1
<b>Quick stop active</b>	0	0	0	1	1	1
<b>Fault reaction active</b>	0	0	1	1	1	1
<b>Fault</b>	0	0	1	0	0	0

The following table indicates which functionalities can be activated on every state. External brake can only applied if it is present, and high-level power applied is only selectable in controllers with an embedded contactor/switch for the power stage.

<b>Function</b>	<b>Not Ready to Switch On</b>	<b>Switch On Disable</b>	<b>Ready to Switch On</b>	<b>Switch On</b>	<b>Operation Enabled</b>	<b>Quick Stop Active</b>	<b>Fault Reaction Active</b>	<b>Fault</b>
<b>Brake applied, if present</b>	Yes	Yes	Yes	Yes	Yes/No(*)	Yes/No(*)	Yes/No(*)	Yes

Low-level power applied	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
High-level power applied	Yes/No(**)	Yes/No(**)	Yes/No(**)	Yes	Yes	Yes	Yes	Yes/No(**)
Drive function enabled	No	No	No	No	Yes	Yes	Yes	No
Configuration allowed	Yes	Yes	Yes	Yes	No	No	No	Yes
Shunt control enabled	No	No	No	No	Yes	Yes	Yes	No

(\*)In some states, brake could be activated and/or deactivated manually.

(\*\*)In some controllers, high-level switch is not present and therefore high level power could not be deactivated.

Transition	Event	Action
0	Automatic transition after power-on or reset application.	Drive device self-test and/or self initialization is performed.
1	Automatic transition after initialization.	Communications are activated.
2	Shutdown command received from control device or local signal.	-

3	Switch on command received from control device and enable signal is activated (if available) or local signal.	The high-level power is switched on.
4	Enable operation command received from control device and enable signal is activated (if available) or local signal.	The drive function is enabled, Initial angle determination process is executed and all internal set-points cleared.
5	Disable operation command received from control device or enable signal is deactivated (if available) or local signal.	The drive function is disabled.
6	Shutdown command received from control device or enable signal is deactivated (if available) or local signal.	The high-level power is switched off.
7	Quick stop or disable voltage command received from control device or local signal.	-
8	Shutdown command received from control device or enable signal is deactivated (if available).	The drive function is disabled, and the high-level power is switched off.

9	Disable voltage command from control device or local signal.	The drive function is disabled, and the high-level power is switched off.
10	Disable voltage or quick stop command received from control device or local signal.	The high-level power is switched off.
11	Quick stop command received from control device or local signal.	The quick stop function is started.
12	Automatic transition when the quick stop function is completed or disable voltage command is received from control device (depending on 0x605A - Quick stop option code).	The drive function is disabled, and the high-level power is switched off.
13	Fault signal.	The configured fault reaction function is executed.
14	Automatic transition.	The drive function is disabled, and the high-level power is switched off.
15	Fault reset command received from control device or local signal.	A reset of the fault condition is carried out, if no fault exists currently on the drive device; after leaving the Fault state, the Fault reset bit in the control word is cleared by the control device.

16	Enable operation command from control device.	The drive function is enabled.
----	---	--------------------------------

**Caution:**

※When drive function is disabled, no energy will be supplied to the motor. Target or set-point(torque, velocity, position) in that situation are not processed.

※High-level power is switched off only in systems with contractors or switches for this purpose.

※Enable signal will affect only if it is marked as available in the corresponding register. See Enable/Disable input for further information.

## Update Log

Version	Update date (M/D/Y)	Description
022	10.14.2020	Update content copy from Chinese ver. 022
023	10.14.2020	Update interrupt
03	10.14.2020	Update ECM-XF ADC, DAC, GPIO, QEI, and FIFO clear function, resequence all function description
031	10.15.2020	Update set/get Rx/Tx FIFO count
032	01.18.2021	Update Error State(0x09) Update ECM_CMD_ECAT_PDO_CONFIG_SET Command Description
033	01.29.2021	Update ECM_CMD_402_CONFIG_SET ECM_CMD_402_STATE_SET ECM_CMD_402_STATE_GET ECM_CMD_402_CTL_SET ECM_CMD_402_CTL_GET
034	02.18.2021	SPI packet data length correction
035	03.11.2021	Correct unit on timeout, ECM_CMD_CRC_TYPE_SET Add ECM_CMD_ECAT_INIT_DC_OP, ECM_CMD_ECAT_STATE_UPDATE
036	07.09.2021	Add ECM_CMD_FIFO_INIT Modify ECM_CMD_ECAT_INIT_OP content Add DAC delay time content

037	07.29.2021	Add ECM_CMD_ECAT_INT_SET_ENABLE & ECM_CMD_ECAT_INT_GET_ENABLE descriptions Modify interrupt diagram explanation
038	08.04.2021	Add ECM_CMD_ECAT_WKC_CONTI_ERR_MAX_GET and ECM_CMD_ECAT_WKC_CONTI_ERR_MAX_SET
038	08.10.2021	Add ECM_CMD_402_CONFIG_SET internal 402 state machine description
